Reflection Journal

When we all started this assignment, we were very lost. We are still lost, and I think we will continued to be lost as we submit it, regardless we got our first taste of an actual data set, that being iris. I am still learning more about pandas since I was fixated on the Tkinter python module for a couple of years and didn't touch nor hear about that many libraries outside of something called "OpenCV". One of the biggest issues we had, was the fact that other classes had taught us how to create a Jupyter notebook and had us learn the first steps to GitHub and git/git desktop, the hard part had came when he had to deal with Jupyter environment setup for some of our group-mates. One thing I didn't anticipate was the fact that some of us were on different operating systems, which made setting up a virtual environment difficult and we only ended up with more problems than solutions along the way, so we decided to switch to Google Collab. Immediately, we gained a benefit in not having to setup a virtual environment since the notebook was running on the cloud. One challenge we had was that some of us had no idea how to use libraries such as pandas, let alone some of us not having a clue as to how to use python.

In this lab, we learned how to navigate a notebook environment and import essential Python data science libraries. My group mates reported that they loaded a dataset into a Pandas DataFrame, used Matplotlib to explore it with a scatter plot, and calculated basic statistics using NumPy. What stood out most was how quickly these tools let me test an idea, such as changing two column names in

the plotting code was enough to reveal that petal measurements separate the species far better than sepal measurements do.
